

Internship Report

Full-Stack Developer Intern — Bewizit

Student	Emilien Amon
Host company	Bewizit — web & mobile app development agency
Location	2 rue de Vienne
Internship period	June 7 – July 8, 2026 (one month)
Role	Full-Stack Developer Intern
Supervisor	Alexandre Wizel, CEO
Report language	English

In June and July 2026 I spent one month at Bewizit as a full-stack developer intern, working across three of the company's products — weteam, periscorp and periscorp-deck — while helping the team get more out of its AI-assisted development workflow.

PART 1 — INTERNSHIP REPORT

1. Introduction

Bewizit is a small web and mobile development agency at 2 rue de Vienne, building products for client companies. I spent one month there, from June 7 to July 8, 2026, as a full-stack developer intern reporting directly to Alexandre Wizel, the CEO. My job, in short: help the team code faster and cheaper with AI tools, and tighten up the structure of a few of their products.

2. Objectives and Missions

The brief from day one was to bring more automation into how the team builds software, cut down on token usage — a real cost when your whole team codes with AI — and clean up the structure of a few ongoing projects. I split my time across three products:

Project	My mission
wetteam	New SaaS product — I worked on making the development workflow behind it more efficient.
periscorp	The company's flagship, more mature app — I focused on its underlying project structure.
periscorp-deck	Pitch-deck viewer for periscorp — I organized the GitHub project so the deck could be presented and maintained properly.

3. Tasks in Context

Bewizit builds apps and websites that help other companies run better. Working directly under the CEO meant my work fed straight into that: a smoother internal workflow and better-structured products both mean faster delivery, which for a small agency is a real competitive edge. Cutting token usage mattered too — AI-assisted coding is now a recurring cost for Bewizit, not just a convenience.

4. Technical Overview of the Products

The three products differ a lot in age and stack, which meant adapting my approach to each rather than applying one template:

Project	Stack	Notes
wetteam	TypeScript, React, Next.js, Supabase, Tailwind, Turborepo	Newest codebase, i18n-ready monorepo — a good place to introduce leaner AI-assisted habits.
periscorp	PHP/Symfony + GraphQL API, Next.js, pnpm workspaces, Docker, JWT (RS256)	Oldest and largest codebase — needed clean-up rather than new features.
periscorp-deck	Next.js, shadcn/ui, Markdown-driven slides	Built to pitch periscorp to investors and clients.

5. Tools and Technical Difficulties

Over the month I picked up, and gradually mastered, four main tools:

Tool	What it was for	Level reached
GitHub	Version control and the PR workflow across four repositories	Mastered very well
Claude Code	AI-assisted coding, day to day	Mastered quite well
Slack	Talking with the CEO and the team	Mastered well
VS Code	Daily editor	Mastered

Figure 1 — “Projects” dashboard (Vercel-style) showing the three projects I worked on — *periscorp-deck*, *weteam-app*, *weteam-web* — with their GitHub repositories and recent commits.

[SCREENSHOT TO INSERT HERE]

Figure 2 — My GitHub activity timeline for June 2026: 33 commits across 3 repositories, 2 repositories created, and 53+ pull requests opened across 4 repositories.

The main hurdle was simply that I'd barely touched these tools before. Week one went almost entirely into learning GitHub's collaborative workflow and Claude Code properly, before I could get to real project work. I got there by mixing hands-on trial and error with reading the docs — testing things on small scopes before touching real code. It paid off: by week two, both tools felt natural.

6. Knowledge Applied and a Concrete Example

I brought core programming and structuring skills from my engineering training, though my GitHub experience wasn't up to a professional team's pace at first — I had to relearn branches, pull requests and code review on the job. What I hadn't expected to learn was how a very small company actually runs day to day, with the CEO handling technical supervision directly since there's no management layer in between.

The clearest example of putting a new skill to use: once I had a real handle on GitHub's PR workflow and Claude Code, I opened a pull request that changed how the team structured its AI coding sessions, so each one didn't have to re-explain project context from scratch. That small process change directly supported the CEO's goal of cutting the cost of AI-assisted development.

Figure 3 — A pull request I created to improve the team's development efficiency.

7. Reflection on Situations Encountered

The recurring challenge wasn't one specific incident — it was learning to work efficiently with unfamiliar tools in a team too small to run a proper onboarding. I leaned on my supervisor with questions early on, then deliberately pushed myself to research and test things on my own, which freed up his time and forced me to actually understand the tools rather than copy instructions. If I did it again, I'd study each tool properly before day one instead of learning it on the fly.

8. Sustainable Development

Bewizit is too small to have a written CSR policy, but it runs on the “Accord Toltèque” (the Four Agreements) as an informal code of conduct to keep the team's culture healthy. On impact: both weteam and periscorp exist to help other companies work better, which gives my work a clear, if indirect, social upside. I didn't find an equivalent environmental angle to the company's activity.

A full environmental policy would be overkill for a team this size, but a realistic first step would be to formalize something already close at hand — tracking and cutting token/compute usage, which I already worked on, as a lightweight environmental metric alongside the existing social code. My overall grade for the company's CSR: 14/20 — 10/10 on the social side thanks to the Accord Toltèque and the close-knit team culture, 4/10 on the environmental side since there's no formal policy at all.

9. Internship Search Process

I found this internship through my network rather than a formal application process — I reached out to find someone willing to take me on and teach me something outside my usual field. It worked well here: I ended up with a supervisor genuinely invested in my growth. The downside is I only seriously considered one option. Next time, I'd combine networking with a broader set of formal applications, so I have more to compare and more room to negotiate.

10. Contribution to Career Plan

Before this internship, I was set on physics research — a field with little overlap with full-stack development, which is exactly why I chose this internship: to try something different. It didn't change that plan. What it did confirm is that the habits that plan depends on — learning things on my own, mastering tools properly, solving problems methodically — carry over cleanly into a completely different field, which only makes me more confident in it.

PART 2 — EXECUTIVE SUMMARY

A condensed version of the report above — organization chart, task timeline and skills mapping — for a quick read.

11. Company Overview and Organization Chart

Bewizit is a very flat structure: no management layer between the CEO and the operational team. I reported directly to Alexandre Wizel throughout the internship.

Alexandre Wizel
CEO

reports to

Emilien Amon
Full-Stack Developer Intern — weteam / periscorp /
periscorp-deck

12. Tasks Performed, Linked to the Timeline

Period	Focus	Main activity
Week 1 (Jun 7–13)	Onboarding	Learning GitHub, Claude Code, Slack and VS Code from a standing start.
Week 2 (Jun 14–20)	periscorp	Working on the project structure of the company's main app.
Week 3 (Jun 21–27)	weteam	Optimizing the dev workflow for the new SaaS product.
Weeks 4–5 (Jun 28–Jul 8)	periscorp-deck	Structuring the GitHub project and content for the pitch-deck viewer.

13. Skills Mapped to My Future Profession

Skill	Used how	Relevance to research
Autonomous problem-solving	Learning new tools with little onboarding	Core to independent research
Git/GitHub	53+ pull requests across 4 repositories	Reproducibility and traceability
AI-assisted iteration (Claude Code)	Speeding up and optimizing dev workflows	Transfers to computational research
Communicating with non-specialists	Explaining technical decisions to the CEO	Communicating research to non-experts

14. Search Process & Career Contribution (Summary)

I found this internship through my network, not a formal search — it worked well, though next time I'd widen the funnel. It didn't change my career plan (physics research), but confirmed that autonomous learning and real tool mastery carry over to it directly.

15. Sustainable Development (Summary)

Overall CSR grade	14/20
Social	10/10
Environmental	4/10

Bewizit runs on the Accord Toltèque as a social code of conduct but has no formal environmental policy — proportionate to its size, but with room to improve, e.g. tracking token/compute usage as a lightweight environmental metric.

16. Activity Snapshot

A quantitative snapshot of the month, drawn from my GitHub activity across the four repositories I contributed to:

Metric	Count	Notes
Commits	33	Across 3 repositories (weteam, periscorp, periscorp-deck)
Repositories created	2	New repositories I set up and structured from scratch
Pull requests opened	53+	Across 4 repositories, reflecting the PR-driven workflow I adopted

17. Conclusion

“What struck me most is how polyvalent you need to be to run your own company — and how much it matters that people like Alexandre take the time, even at a tiny scale, to bring in an intern and help shape someone else's future.”

[SCREENSHOT TO INSERT HERE]

Paired illustration — my work on the periscorp pitch deck: a small, concrete trace of that polyvalence in practice.

Acknowledgements

Thanks to Alexandre Wizel for bringing me on, trusting me with real production work across three products, and supervising me personally throughout the month.

APPENDIX — GLOSSARY

Quick definitions of the technical terms used above, for a reader unfamiliar with software development.

SaaS	Software delivered online rather than installed locally (e.g. weteam).
Monorepo	One code repository holding several related apps/packages, kept in sync (weteam, periscorp).
GraphQL	A query language for APIs — lets a frontend ask a backend for exactly the data it needs.
API	The interface through which two pieces of software exchange data.
JWT (RS256)	A signed digital token used to prove a user's identity between frontend and API.
Repository	A project's storage space on GitHub, holding its code and full history.
Pull request	A proposed change to a repository, reviewed before being merged.
Commit	A single recorded change to the code, with a description of what changed and why.
Token (AI)	A unit of text an AI model processes — what drives the cost of AI-assisted coding.
Claude Code	Anthropic's command-line AI coding assistant, used at Bewizit to write and structure code.
CSR	Corporate Social Responsibility — a company's social and environmental policies.
Accord Tolèque	"The Four Agreements" — personal-conduct principles Bewizit uses informally.

Declaration

I declare that this report reflects my own personal experience and observations during my internship at Bewizit, and that I wrote it myself for the purpose of this internship evaluation.
