

Internship Report

Full-Stack Developer Intern — Bewizit

Student	Emilien Amon
Host company	Bewizit — web & mobile application development agency
Location	2 rue de Vienne
Internship period	June 7 – July 8, 2026 (one month)
Role	Full-Stack Developer Intern
Supervisor	Alexandre Wizel, CEO
Report language	English

During this one-month internship, I worked as a Full-Stack Developer Intern at Bewizit, contributing to three of the company's products — weteam, periscorp and periscorp-deck — with a focus on optimizing the team's AI-assisted development workflow and strengthening project structure.

1. Introduction

Bewizit is a small web and mobile application development agency based at 2 rue de Vienne, building digital products for client companies to help them improve their productivity. I completed a one-month internship there, from June 7 to July 8, 2026, as a Full-Stack Developer Intern, working under the direct supervision of Alexandre Wizel, the company's CEO. My mandate was to help optimize the team's development workflow — in particular its use of AI-assisted coding tools — and to strengthen the technical structure of several of the company's ongoing products.

2. Objectives and Missions

The objectives set at the start of the internship were to help automate parts of the development process through new AI-assisted workflows, to optimize the team's token usage — a direct operating cost for a company that relies heavily on AI coding assistants — and to contribute to the technical structuring of several of the company's projects. To meet these objectives, I worked across three products, each with a distinct mission:

Project	What it is	My mission on it
weteam	New SaaS product for team development	Optimize the workflow/system behind its development so the team could work more efficiently.
periscorp	The company's main, more mature application	Work on the underlying project structure of the app.
periscorp-deck	Pitch-deck viewer used to commercialize periscorp	Build out and organize the GitHub project structure to support a presentation-ready deck.

3. Tasks in Context

Bewizit's business is designing and building web and mobile applications for client organizations, helping them become more productive. Working directly with the CEO on the technical side meant my work fed straight into the company's core value proposition: better internal tooling and better-structured client-facing products both affect delivery speed and cost, which for a small agency translates directly into competitiveness. My focus on reducing AI/token costs specifically ties into the company's margins, since AI-assisted coding is now a meaningful and recurring cost line for Bewizit.

4. Company & Products — Technical Overview

Understanding the technical shape of each product was a prerequisite for the structuring work I was asked to do. The three products differ significantly in maturity and stack, which meant adapting my approach to each one rather than applying a single template:

Project	Stack	Context & my focus
weteam	TypeScript, React, Next.js, Supabase, TailwindCSS, Turborepo	A SaaS platform for team development (surveys, diagnostics, qualitative interviews), built as an i18n-ready monorepo. Being the newest codebase, it was the natural place to introduce more efficient, less token-hungry AI-assisted development habits.
periscorp	PHP (Symfony-based API with GraphQL), Next.js, pnpm workspaces, Docker, JWT (RS256)	The company's main application: a monorepo combining a PHP/GraphQL API with a Next.js web frontend. Being the oldest and largest codebase, it needed structural clean-up rather than new features.
periscorp-deck	Next.js, shadcn/ui, Markdown-driven slide content	A pitch-deck viewer used to present periscorp to investors and clients. My work here focused on organizing the GitHub repository and content structure so the deck could be maintained and presented professionally.

5. Techniques, Tools and Technical Difficulties

Over the course of the internship I used and progressively mastered the following tools:

Tool	What it was used for	Level reached
GitHub	Version control, branching, and the pull-request workflow across four repositories	Mastered very well
Claude Code	AI-assisted coding assistant used for day-to-day development and workflow optimization	Mastered quite well
Slack	Team communication with the CEO and collaborators	Mastered well
VS Code	Day-to-day code editor	Mastered

Figure 1 — "Projects" dashboard (Vercel-style view) showing the three projects I worked on — periscorp-deck, weteam-app, weteam-web — with their GitHub repositories and recent commits.

Figure 2 — My GitHub activity timeline for June 2026: 33 commits across 3 repositories, 2 repositories created, and 53+ pull requests opened across 4 repositories.

The main technical difficulty was that, at the very start, I had only limited hands-on experience with these tools. The first week was therefore spent largely on learning GitHub's collaborative workflow and Claude Code properly, rather than producing project code. I approached this by pairing

hands-on experimentation with structured research — reading documentation and testing workflows on small scopes before applying them to real projects — an investment that paid off in the following weeks, once both tools became second nature.

6. Knowledge Applied and a Concrete Example

From my engineering training I applied core programming and software-structuring skills, although my prior experience with GitHub was initially insufficient for the pace of a professional team: I had to relearn collaborative git workflows — branches, pull requests, code review — on the job. Beyond technical skills, the internship taught me how a very small company is actually organized and run day to day, including how a CEO personally supervises technical execution when the team has no intermediate management layer.

A concrete example of applying a newly-learned skill to a real problem: once I had gained real command of GitHub's pull-request workflow and of Claude Code, I opened a pull request that restructured part of the team's AI-assisted development process to reduce wasted token usage. Instead of letting each coding session re-explain project context from scratch, I documented and applied a more disciplined branching and PR convention so that AI-assisted sessions could reuse existing structure and context. This directly supported the CEO's stated objective of lowering the operational cost of AI-assisted development.

[SCREENSHOT TO INSERT HERE]

Figure 3 — A pull request I created to improve the team's development efficiency.

7. Reflection on Situations Encountered

The main difficulty I faced was less a single incident than a standing challenge: learning to work efficiently with tools I had never used professionally, inside a team too small to provide dedicated onboarding. In the first week, I compensated by asking my supervisor frequent questions. As I built familiarity, I deliberately shifted toward researching and testing solutions independently before asking for help — which both freed up my supervisor's time and forced me to build a deeper, more transferable understanding of the tools. In hindsight, I would try to compress that first learning curve further by researching each tool in a structured way before day one, rather than learning it reactively on the job.

8. Sustainable Development

Being a very small structure, Bewizit does not have a formal, written CSR policy. It does, however, apply the "Accord Tol  que" (the Four Agreements) as an internal code of conduct to maintain a healthy social environment within its small team. In terms of impact, the products I contributed to — weteam and periscorp — both have a positive social dimension, since their entire purpose is to

help other companies function better: weteam supports organizational and team development, while periscorp and periscorp-deck support other businesses' operations and fundraising. I did not identify a comparable environmental dimension to the company's activity.

Given the company's size, a full environmental policy would be disproportionate, but a realistic first step would be to formalize simple, low-cost practices already implicit in remote, AI-assisted work — for example, tracking and minimizing token/compute usage, which I already worked on, as a lightweight environmental metric alongside the existing social code of conduct. Overall, I would rate the company's CSR performance at **14/20**: strong on the social dimension (10/10, thanks to the Accord Toltèque and the team's small, direct working culture) but weak on the environmental dimension (4/10, reflecting the absence of any formal environmental policy).

9. Internship Search Process

I found this internship through personal networking rather than a formal application process, reaching out within my network to find a professional willing to bring me on and help me build skills outside my usual academic field. This channel worked well in this specific case: it matched me with a company and supervisor genuinely invested in my development. Its main limitation is that I only seriously considered one opportunity rather than comparing several. For a future search, I would broaden the funnel by combining networking with a wider set of formal applications, giving myself more room to compare roles and negotiate scope.

10. Contribution to Career Plan

Before this internship, my career plan was oriented toward research in physics — a field with limited direct overlap with full-stack web development. I deliberately chose this internship to explore a different professional environment. It did not change that underlying plan: I still intend to pursue physics research. What it did confirm is that the working habits at the core of that plan — autonomous learning, rigorous tool mastery, and structured problem-solving — transfer directly to a completely different domain, which reinforces rather than diverts my confidence in that direction.

PART 2 — EXECUTIVE SUMMARY

This section condenses the report above into a synthesis format, with the organization chart, task timeline and skills mapping requested for a quick, visual read of the internship.

11. Company Overview and Organization Chart

Bewizit is a very small, flat structure: there is no intermediate management layer between the CEO and the operational team. I reported directly to Alexandre Wizel throughout the internship.

12. Tasks Performed, Linked to the Timeline

Period	Project focus	Main activity (reporting directly to the CEO throughout)
Week 1 (Jun 7 – Jun 13)	Onboarding	Learning GitHub's collaborative workflow, Claude Code, Slack and VS Code from a standing start.
Week 2 (Jun 14 – Jun 20)	periscorp	Working on the project structure of the company's main, more mature application.
Week 3 (Jun 21 – Jun 27)	weteam	Optimizing the workflow/system behind the new SaaS product for more efficient development.
Week 4–5 (Jun 28 – Jul 8)	periscorp-deck	Structuring the GitHub project and content for the pitch-deck viewer used to commercialize periscorp.

13. Skills Mapped to My Future Profession

Skill developed	How it was used during the internship	Relevance to a research career
Autonomous problem-solving	Learning new tools with minimal onboarding, on my own initiative	Core skill for independent scientific research
Version control & documentation (Git/GitHub)	Managed branches and 53+ pull requests across 4 repositories	Reproducibility and traceability of research work
AI-assisted iteration (Claude Code)	Applied to speed up and optimize development workflows	Directly transferable to computational research workflows
Communication with non-specialists	Explaining technical work and decisions to the CEO	Communicating research to non-expert audiences

14. Search Process & Career Contribution (Summary)

I secured this internship through personal networking rather than a formal search; it worked well here but I would widen the funnel next time. The experience did not change my career plan — physics research — but confirmed that autonomous learning and rigorous tool mastery, developed here in a software context, transfer directly to that goal.

15. Sustainable Development (Summary)

Overall CSR grade: 14/20
Social: 10/10 • Environmental: 4/10

Bewizit applies the Accord Toltèque as a social code of conduct but has no formal environmental policy, which is proportionate to its size but leaves room for improvement (e.g. tracking token/compute usage as a lightweight environmental metric).

16. Activity Snapshot

As a final, quantitative illustration of the month, the table below summarizes my GitHub activity across the four repositories I contributed to, drawn directly from my activity timeline for June 2026.

Metric	Count	Notes
Commits	33	Across 3 repositories (weteam, periscorp, periscorp-deck)
Repositories created	2	New repositories I set up and structured from scratch
Pull requests opened	53+	Across 4 repositories, reflecting the PR-driven workflow I adopted

17. Conclusion

"What impressed me most is how polyvalent you must be to run your own company, and how much it matters that people like Alexandre take the time, even at a very small scale, to bring in an intern and help shape someone else's future skills."

[SCREENSHOT TO INSERT HERE]

Paired illustration — my work on the periscorp pitch deck: a small, concrete trace of that polyvalence in practice.

Acknowledgements

I would like to thank Alexandre Wizel for taking the time, at such a small company scale, to bring me on, trust me with real production work across three products, and personally supervise my progress throughout the month.

APPENDIX — GLOSSARY OF TERMS

This glossary defines the technical terms used in this report, so that it remains understandable to a reader unfamiliar with software development.

SaaS	"Software as a Service" — an application delivered online rather than installed locally (e.g. weteam).
Monorepo	A single code repository holding several related applications/packages, kept in sync together (used by weteam and periscorp).
GraphQL	A query language for APIs that lets a frontend ask a backend for exactly the data it needs.
API	"Application Programming Interface" — the interface through which two pieces of software exchange data.
JWT (RS256)	"JSON Web Token" — a secure, signed digital token used to prove a user's identity between the frontend and the API.
Repository (repo)	A project's storage space on GitHub, containing its code and full history of changes.
Pull request (PR)	A proposed change to a repository, submitted for review before being merged into the main codebase.
Commit	A single, recorded change to the code, saved with a description of what changed and why.
Token (AI usage)	A unit of text an AI model processes; the number of tokens used directly drives the cost of AI-assisted coding.
Claude Code	Anthropic's command-line AI coding assistant, used at Bewizit to help write and structure code.
CSR	"Corporate Social Responsibility" — a company's policies regarding its social and environmental impact.
Accord Toltèque	"The Four Agreements" — a set of personal-conduct principles Bewizit uses informally to foster a healthy team culture.

Declaration

I declare that this report reflects my own personal experience and observations during my internship at Bewizit, and that it was written by me for the purpose of this internship evaluation.

Emilien Amon
